Academic Year

2026–2027

SANJIVANI UNIVERSITY, KOPARGAON

1. Introduction to Software Product Development

Software development is more than writing code and making an application work. A proper software product starts with understanding the problem, users, requirements, and expected results. Planning these things before development helps reduce confusion and makes the final product more useful.

For an academic management system, this planning is important because different users work with the same academic information in different ways. Students need access to their records and academic progress, faculty members need to manage attendance and marks, and administrative staff need accurate records and reports.

The proposed EduTrack – Enterprise Student Record and Academic Management Platform follows a product-oriented approach. The project first studies the academic management process and then identifies user needs, requirements, product features, and future development activities.

1.1 Programming vs. Software Product Engineering

Programming mainly focuses on writing instructions that a computer can execute. Software product engineering covers a much wider process, including understanding the problem, designing the solution, managing data, testing the system, deploying it, and improving it over time.

Aspect	Programming / Coding	Software Product Engineering
Main Focus	Writing code to perform a specific task	Building a complete solution for a real problem
Scope	Functions, modules, or individual programs	Complete product lifecycle
Starting Point	Technical requirement or coding task	User problem and business requirement
User Involvement	Usually limited during coding	Considered throughout product planning
Quality	Code correctness and basic testing	Usability, reliability, security, maintainability, and performance
Outcome	Working program or feature	Useful and maintainable software product

1.2 Why Software Projects Need Proper Planning

A software project can face problems even when the code itself works correctly. These problems can occur when the team does not clearly understand what users need or when important requirements are missed during planning.

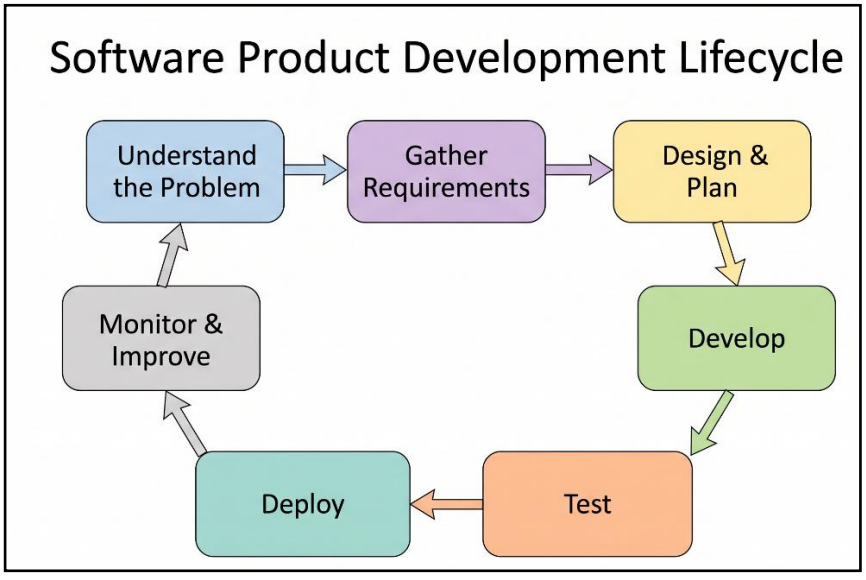

Some common causes are:

- Unclear Requirements: The development team may build features that do not solve the actual user problem.
- Lack of User Understanding: User difficulties may be ignored when the product is planned mainly from a technical point of view.
- Poor Communication: Different stakeholders may have different expectations about the system.
- Late Feedback: Problems discovered near the end of development can require major changes.
- Poor Planning: Without a clear scope and roadmap, unnecessary features may be added while important features are missed.

For EduTrack, these issues are addressed by studying the academic process, identifying stakeholders, gathering requirements, and defining the MVP before future implementation.

1.3 Software Product Lifecycle

Understand the Problem → Gather Requirements → Design → Develop → Test → Deploy → Improve

2. Business Understanding: Academic Management

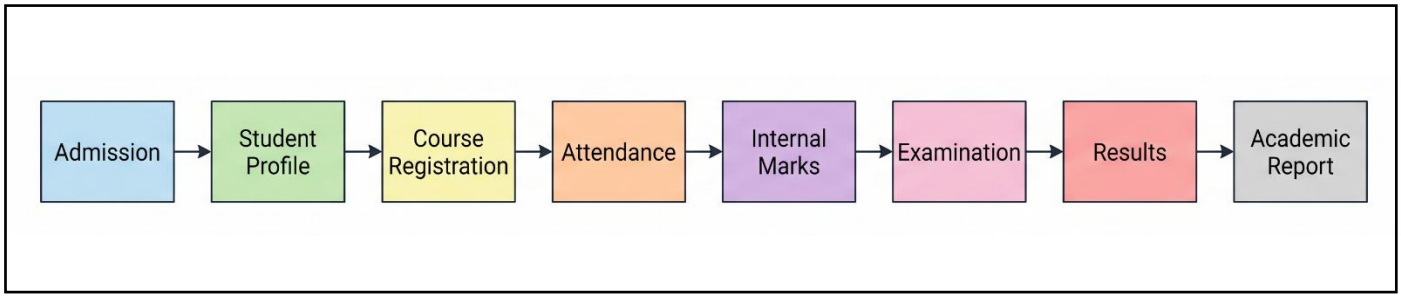

Educational institutions manage a large amount of student information throughout an academic year. This includes student details, course registration, attendance, internal marks, examinations, results, and academic reports.

In many colleges, these activities may be handled through different records, spreadsheets, or separate systems. This can make it difficult to maintain information properly and access the required data when needed.

The proposed EduTrack – Enterprise Student Record and Academic Management Platform aims to bring these academic activities into one organized platform. The main purpose is to make student academic information easier to manage, access, and maintain.

2.1 Core Academic Management Operations

Operation	Purpose
Student Registration	Maintain basic student information and academic details
Course Registration	Record the courses selected by students
Attendance Management	Maintain and track student attendance
Internal Assessment	Store internal marks and academic performance
Examination Management	Manage examination-related academic information
Result Management	Maintain marks, grades, and final results
Academic Reports	Generate useful academic reports from stored records

2.2 Current Process Challenges and Proposed Solution

The existing process can become difficult when academic information is maintained in different places. EduTrack proposes a centralized approach where important student academic information can be managed through a common platform.

Current Challenge	Proposed EduTrack Approach
Student information stored in different records	Centralized student profile
Course information maintained separately	Centralized course registration
Attendance records may be difficult to track	Organized attendance records
Marks stored in separate records	Centralized academic performance records
Result information requires manual checking	Organized result management
Reports take additional effort to prepare	Academic report generation
Different users need different information	Role-based access for students, faculty, and administrators

The proposed system is designed around the actual academic workflow rather than adding unnecessary features. This helps keep the initial product focused on the main needs of students, faculty members, and administrative staff.

3. Introduction to Design Thinking

Design Thinking is a problem-solving approach that focuses on understanding users before developing a solution. Instead of directly starting with coding, it first tries to understand the actual problem, user needs, and difficulties.

In software product development, Design Thinking helps the development team create solutions that are useful and easy for people to use. It also allows ideas to be tested and improved before the complete product is developed.

For the EduTrack project, Design Thinking is used to understand the problems faced by students, faculty members, and administrative staff while managing academic information.

3.1 Importance of Design Thinking

Design Thinking is useful for EduTrack because different users have different requirements.

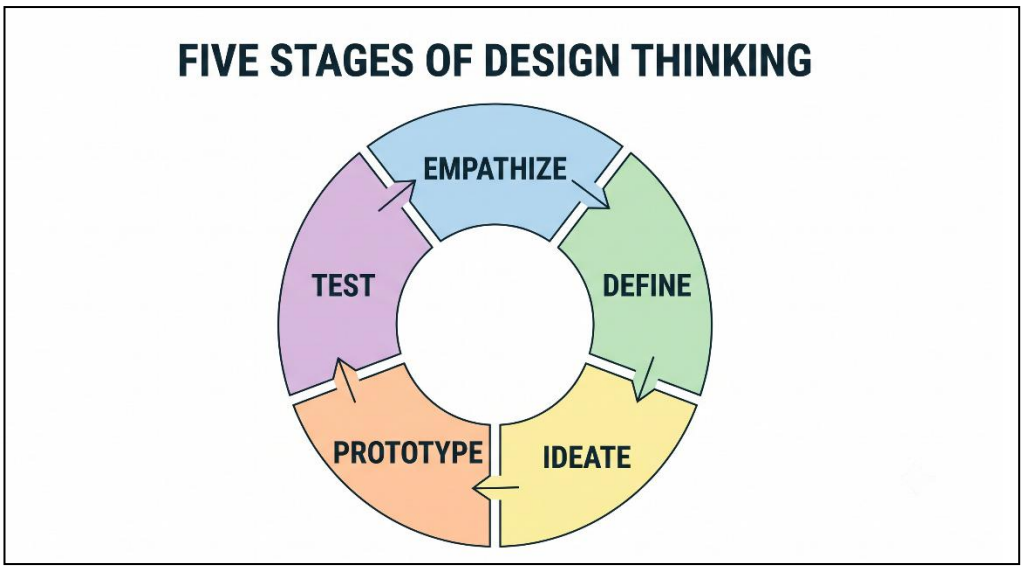

- **Student:** needs easy access to academic information.
- **Faculty:** needs simple methods to manage attendance and marks.
- **Administrator:** needs organized student records and reports.
- **Examination Cell:** needs accurate examination and result information.
- **IT Support:** needs a system that is reliable and manageable.

3.2 Five Stages of Design Thinking

The Design Thinking process used in this project consists of five main stages:

Stage	Purpose
Empathize	Understand users and their problems
Define	Clearly identify the main problem
Ideate	Generate possible solutions
Prototype	Create an initial version of the solution
Test	Check the solution with users and improve it

4. Applying the Five Stages of Design Thinking

Design Thinking helps in developing a software product by starting with the user's problem instead of directly starting with development. For the EduTrack project, the five stages are used to understand academic management problems and gradually develop a suitable product idea.

- The five stages are **Empathize, Define, Ideate, Prototype, and Test**.

4.1 Empathize:

The Empathize stage focuses on understanding the users, their activities, problems, and expectations. The purpose is to understand the situation from the user's point of view. For EduTrack, the main users considered are students, faculty members, and administrative staff.

Student Perspective

Students need access to information such as their profile, registered courses, attendance, marks, examination details, and results. If this information is maintained in different places, students may need to contact different departments or faculty members to get the required information.

Faculty Perspective

Faculty members need to manage attendance, internal marks, course-related information, and student academic records. Maintaining these records manually can require additional effort and may make it difficult to find information quickly.

Administrative Perspective

Administrative staff need to maintain student records, courses, academic information, and reports. They also need reliable records when information is required for academic activities.

Problems Identified During Empathy :

User	Common Need / Problem
Student	Wants easy access to personal academic information
Faculty	Needs an organized way to manage attendance and marks
Administrator	Needs centralized student and academic records
Examination Cell	Needs accurate examination and result information
IT Support	Needs a system that is manageable and reliable

4.2 Define:

The Define stage converts the observations from the Empathize stage into a clear problem statement. From the identified problems, the main problem for EduTrack can be defined as:

“Students, faculty members, and administrative staff need a centralized and organized way to manage and access student academic information throughout the academic journey.”

The problem includes different types of information such as student records, course registration, attendance, marks, examinations, results, and academic reports.

Main Problems Defined

- Academic information may be stored in different records.
- Students may not have one place to view their academic information.
- Faculty members need separate records for attendance and marks.
- Administrative staff need organized student information.
- Preparing academic reports may require information from different records.
- Different users require different levels of access to information.

4.3 Ideate

The Ideate stage focuses on generating possible solutions for the defined problems. At this stage, different ideas are considered without immediately deciding the final implementation.

For EduTrack, some possible ideas are:

1. Create a centralized student profile.
2. Provide online course registration.
3. Maintain attendance records digitally.
4. Allow faculty members to enter internal marks.
5. Maintain examination and result information.
6. Generate academic reports.
7. Provide different access levels for students, faculty, and administrators.
8. Provide a dashboard showing important academic information.

After considering these ideas, the project focuses on features that directly support the main academic management process.

Selected Product Direction

- The main product direction is to create a centralized academic management platform that connects student records, courses, attendance, marks, examinations, results, and reports.

4.4 Prototype:

The Prototype stage involves creating an initial representation of the proposed solution. The prototype does not need to be a complete working application. It is used to understand how the planned system may work and to identify possible improvements.

For EduTrack, the prototype can include basic screen designs such as:

- Student Login
- Student Profile
- Course Registration
- Attendance
- Internal Marks
- Examination Information
- Results
- Academic Report
- Faculty Dashboard
- Administrator Dashboard

4.5 Test:

The Test stage is used to collect feedback about the proposed solution or prototype. Users can interact with the prototype and identify problems related to usability, missing information, or unclear features.

For EduTrack, testing can involve students, faculty members, and administrative staff.

Example Testing Questions

- Can students easily find their attendance?
- Is course registration easy to understand?
- Can faculty members enter marks without confusion?
- Can administrators find student records quickly?
- Are the required academic reports available

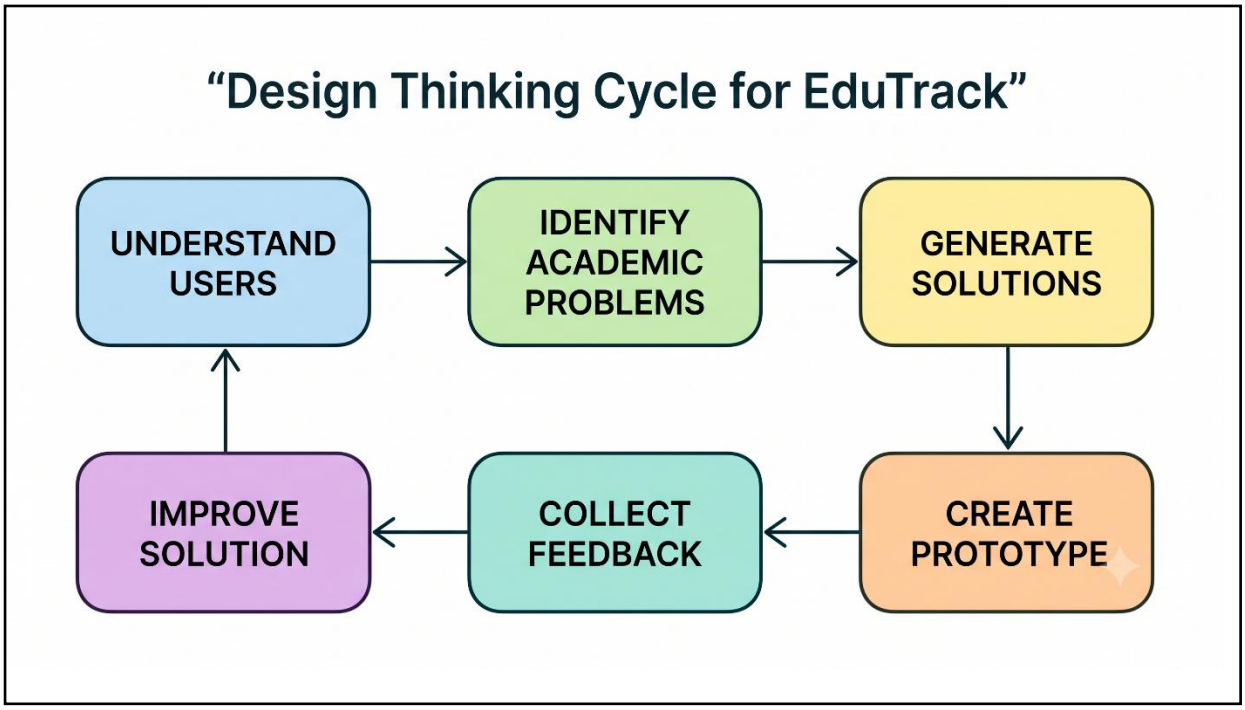

4.6 Design Thinking Cycle for EduTrack

The five stages work together as a continuous process:

Empathize → Define → Ideate → Prototype → Test → Improve

The process may return to an earlier stage when testing identifies a new problem or when users provide new feedback. This makes Design Thinking an iterative approach rather than a one-time process.

For EduTrack, the process starts by understanding academic users, defining their major problems, generating suitable solutions, creating a prototype, and testing the proposed solution before moving towards actual development.

5. Enterprise Expansion: IBM Design Thinking

IBM Design Thinking is a practical approach for developing products by keeping users at the center of the development process. It is useful for enterprise systems because such systems usually have many users with different needs.

The EduTrack platform involves students, faculty members, administrative staff, examination staff, and IT support. Each group interacts with academic information differently. IBM Design Thinking helps the project team understand these differences and develop the product around actual user outcomes.

IBM Design Thinking in this project is based on three main principles:

5.1 Focus on User Outcomes:

The first principle is to focus on what users want to achieve rather than simply listing software features.

For EduTrack, the important user outcomes are:

- **Students:** Easily view their profile, registered courses, attendance, marks, examination details, and results.
- **Faculty:** Manage attendance and marks for the students assigned to them.
- **Administrators:** Maintain accurate student, course, and academic records.
- **Examination Staff:** Manage examination and result-related information.

This principle helps the project team ask an important question:

“What should the user be able to accomplish using EduTrack?”

For example, instead of only saying *“EduTrack will have an attendance module,”* the expected outcome is that a student should be able to check their attendance easily and a faculty member should be able to update it efficiently.

5.2 Restless Reinvention :

Restless Reinvention means continuously improving the product instead of treating the first version as the final solution.

Academic processes and user requirements can change over time. Therefore, EduTrack should be designed so that feedback and new requirements can be considered in future versions.

The improvement cycle can include:

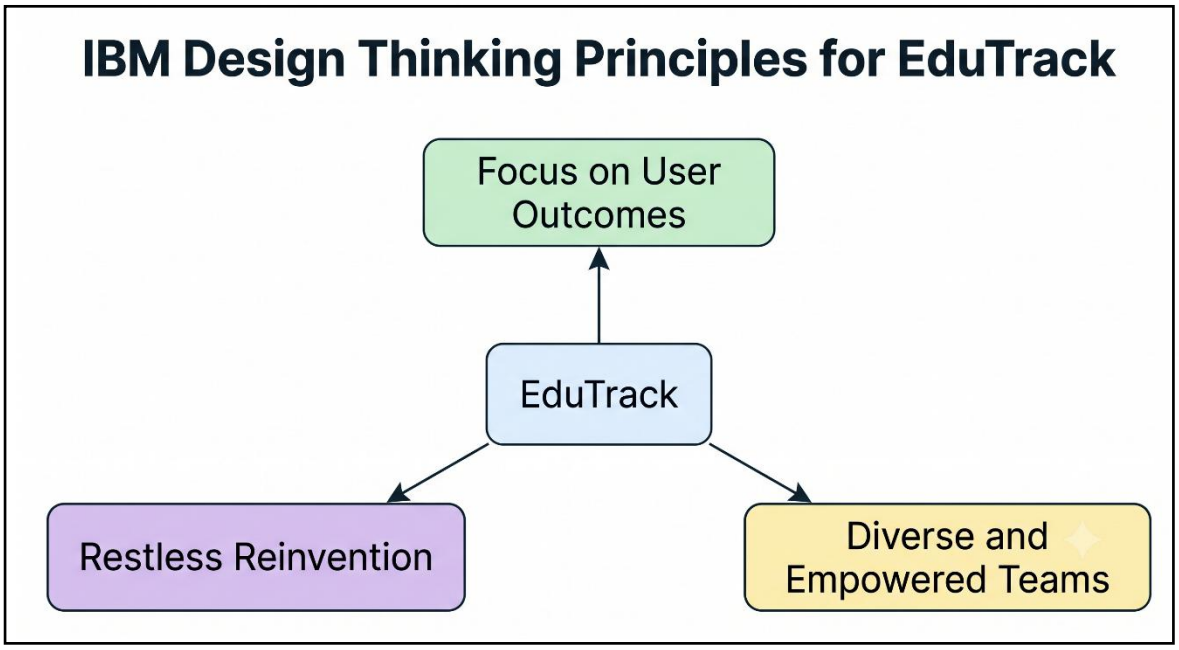

User Feedback → Identify Problem → Improve Solution → Test Again

5.3 Diverse and Empowered Teams

A diverse team brings different experiences and viewpoints to the product development process. This is important for EduTrack because no single user group understands the complete academic management process.

The project should consider inputs from:

Role	Important Input
Student	Academic information access and usability
Faculty	Attendance, marks, and course-related activities
Administrator	Student records and academic management
Examination Staff	Examination and result processes
Developer	Technical feasibility and implementation
IT Support	System maintenance and technical requirements

5.4 Application of IBM Design Thinking to EduTrack

The three principles work together during product planning:

Principle	Application in EduTrack
Focus on User Outcomes	Define what students, faculty, and administrators should be able to accomplish
Restless Reinvention	Improve the product using feedback and changing requirements
Diverse and Empowered Teams	Include different users and technical roles in product decisions

Using these principles helps EduTrack remain user-focused while also supporting continuous improvement and collaboration during future development.

6. IBM Loop Engine

The IBM Loop is a continuous product development approach that helps a team understand users, learn from observations, and create solutions based on those learnings. It consists of three main activities: **Observe, Reflect, and Make**.

Unlike a process that ends after creating a solution, the IBM Loop continues through repeated cycles. The team observes users, reflects on the information collected, makes or improves a solution, and then observes the results again.

For the proposed EduTrack – Enterprise Student Record and Academic Management Platform, the IBM Loop can be used to continuously improve the platform according to the actual needs of students, faculty members, administrative staff, and other stakeholders.

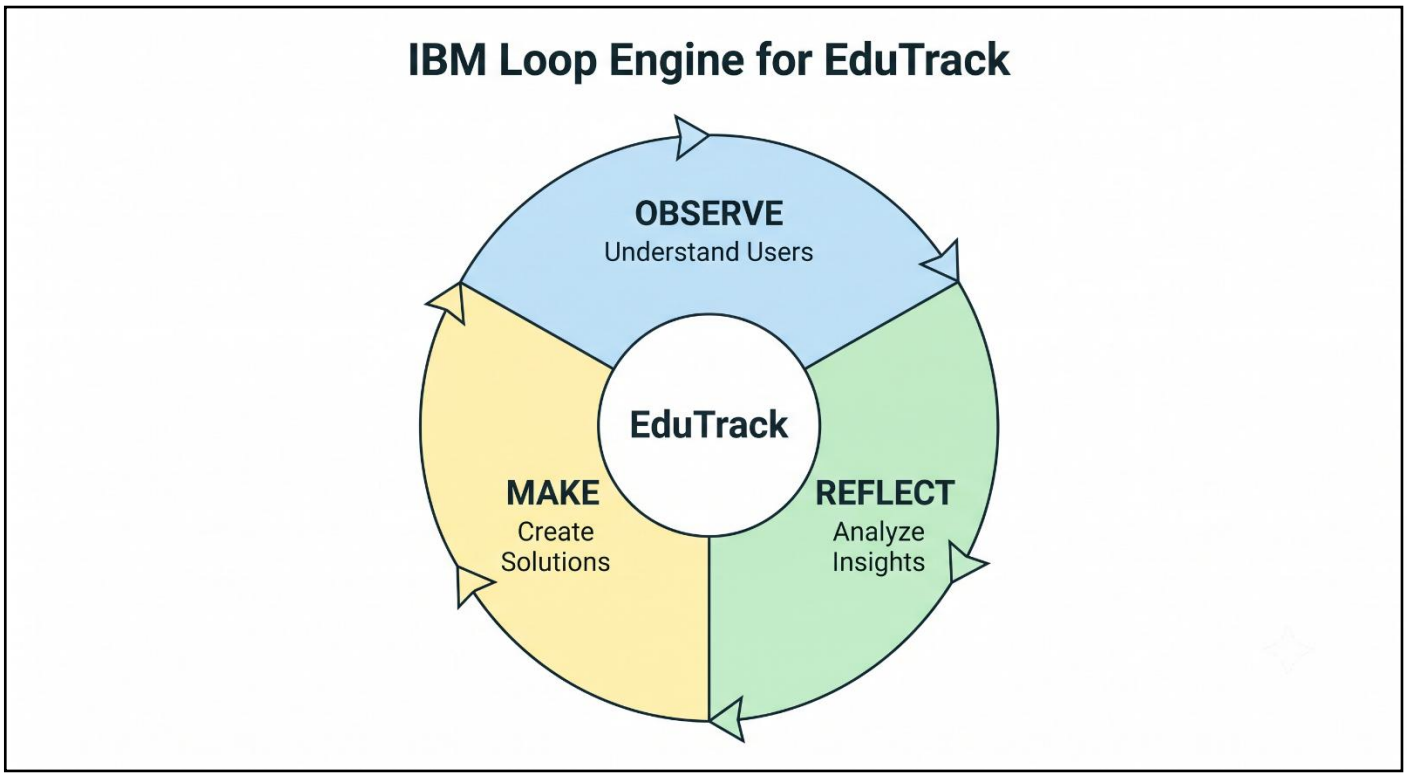

6.1 Observe

The Observe stage focuses on understanding users and their actual activities. The team collects information about how users currently perform academic management tasks and what difficulties they face.

For EduTrack, observation can focus on:

- How students access their academic information.
- How students check attendance, marks, examinations, and results.
- How faculty members record attendance and internal marks.
- How administrative staff maintain student records.
- How examination staff manage examination and result information.
- Where users face delays, repeated work, or difficulty in finding information.

EduTrack Example:
If students need to contact different departments to obtain attendance, marks, or examination information, this observation indicates a need for a more centralized method of accessing academic information.

6.2 Reflect

The **Reflect** stage involves analyzing the information collected during observation. The team identifies common problems, patterns, user expectations, and areas that require improvement.

For EduTrack, the team can reflect on questions such as:

- Which academic information is difficult for users to access?
- Which activities require unnecessary manual work?
- Which problems affect multiple users?
- Which requirements should receive higher priority?
- What information should be available to each user role?

Reflection helps the team convert observations into meaningful product decisions.

EduTrack Example:
If students, faculty, and administrators all face problems because academic information is maintained separately, the team can identify centralized academic record management as an important product requirement.

6.3 Make

The **Make** stage converts the findings into a tangible solution. The team creates a prototype, workflow, screen design, requirement, or other solution that addresses the identified problem.

For EduTrack, possible outputs of the Make stage include:

- Student dashboard prototype.
- Centralized student profile.
- Course registration workflow.
- Attendance management screen.
- Internal marks management screen.
- Examination and result module.
- Academic report generation workflow.

The purpose is not necessarily to create the complete final system immediately. Instead, the team creates something that can be reviewed and tested with users.

EduTrack Example:
Based on the observation that students need easier access to academic information, the team may create a prototype dashboard containing student profile, registered courses, attendance, marks, examination details, and results.

6.4 IBM Loop Applied to EduTrack

IBM Loop Stage	Main Activity	Application in EduTrack
Observe	Understand users and their activities	Study how students, faculty, and administrators manage academic information
Reflect	Analyze observations and identify important needs	Identify problems such as scattered records and difficult information access
Make	Create and improve a possible solution	Develop workflows, prototypes, and product requirements
Repeat	Collect feedback and continue the cycle	Improve EduTrack based on user feedback and new requirements

6.5 Continuous Improvement Through the Loop

The three activities are repeated as the product develops. After a solution is created, users can interact with it and provide feedback. That feedback becomes a new source of observation.

The cycle can therefore be represented as:

Observe → Reflect → Make → Observe → Reflect → Make

For EduTrack, this continuous cycle helps the team identify problems early and improve the proposed platform before and during development.

For example, after creating a student dashboard prototype, students may report that attendance and results are difficult to find. The team can observe this feedback, reflect on the navigation problem, and make an improved dashboard structure. The updated design can then be tested again.

Therefore, the IBM Loop provides a practical way to maintain continuous learning, user involvement, and product improvement throughout the development of EduTrack.

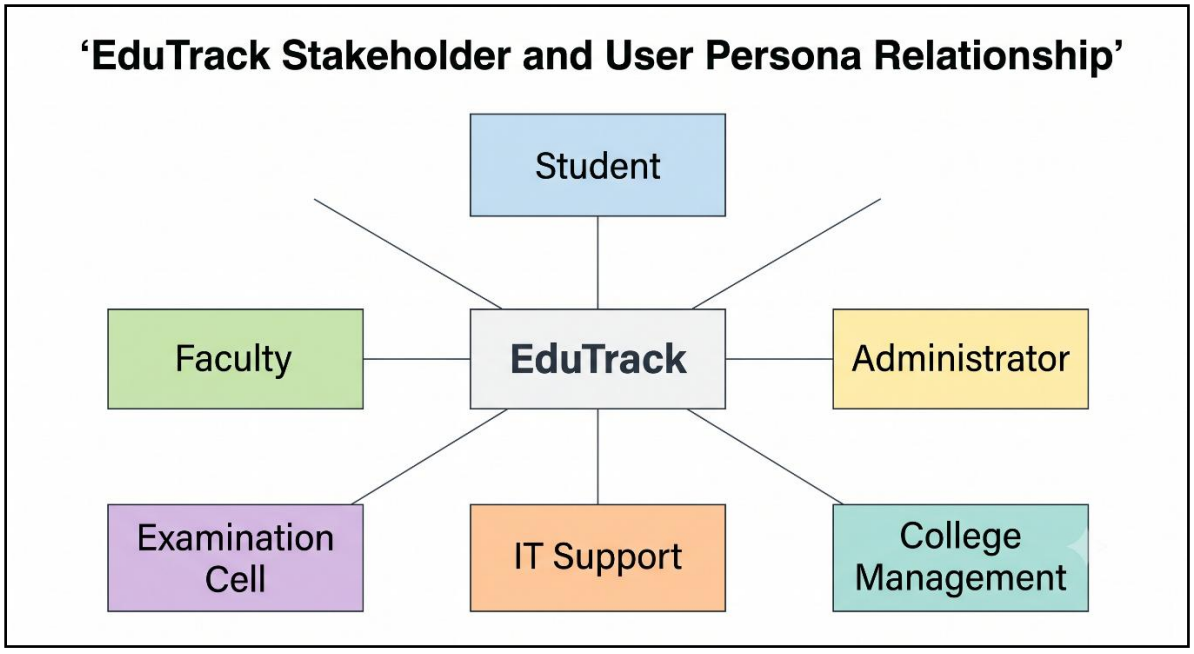

7. Stakeholder & User Personas

Stakeholder analysis helps identify the people who interact with EduTrack or are affected by its operations. Since the platform manages academic information, different stakeholders have different responsibilities and expectations.

The main users of EduTrack are **students, faculty members, and administrative staff**. Other stakeholders such as the Examination Cell, IT Support, and college management also have an important role in the system.

7.1 Key Stakeholders

Stakeholder	Role in EduTrack	Main Requirement
Student	Uses academic services and views personal records	Easy access to academic information
Faculty	Manages attendance, marks, and course-related records	Simple and efficient academic record management
Administrator	Maintains student, course, and academic information	Centralized and accurate records
Examination Cell	Handles examinations and results	Accurate examination and result information
IT Support	Maintains technical operation of the platform	Reliable and manageable system
College Management	Reviews academic information and reports	Useful academic summaries and reports

7.2 User Persona 1 — Student

Name: Student User
Role: Undergraduate Student

Needs:

- View personal profile and academic information.
- Check registered courses.
- View attendance records.
- Check internal marks and examination information.
- Access results and academic reports.

Problems:

- Academic information may be available through different sources.
- Finding updated information can take time.
- Students may need to contact different departments for specific records.

Expected Outcome:
A single platform where the student can easily access important academic information.

7.3 User Persona 2 — Faculty

Name: Faculty User
Role: Teaching Faculty

Needs:

- View assigned courses and students.
- Record and update attendance.
- Enter internal assessment marks.
- View relevant student academic records.

Problems:

- Maintaining separate attendance and marks records can require additional effort.
- Finding student information may take time when records are distributed across different sources.

Expected Outcome:
A structured interface for managing academic records of assigned students.

7.4 User Persona 3 — Administrator

Name: Administrative User
Role: Academic / System Administrator

Needs:

- Manage student records.
- Manage courses and faculty information.
- Maintain academic records.
- Access and generate required reports.

Problems:

- Large numbers of student records require proper organization.
- Manual record management can make searching and updating information difficult.
- Different academic activities may require information from multiple records.

Expected Outcome:
A centralized system for maintaining accurate academic information and generating reports efficiently.

7.5 Persona Summary

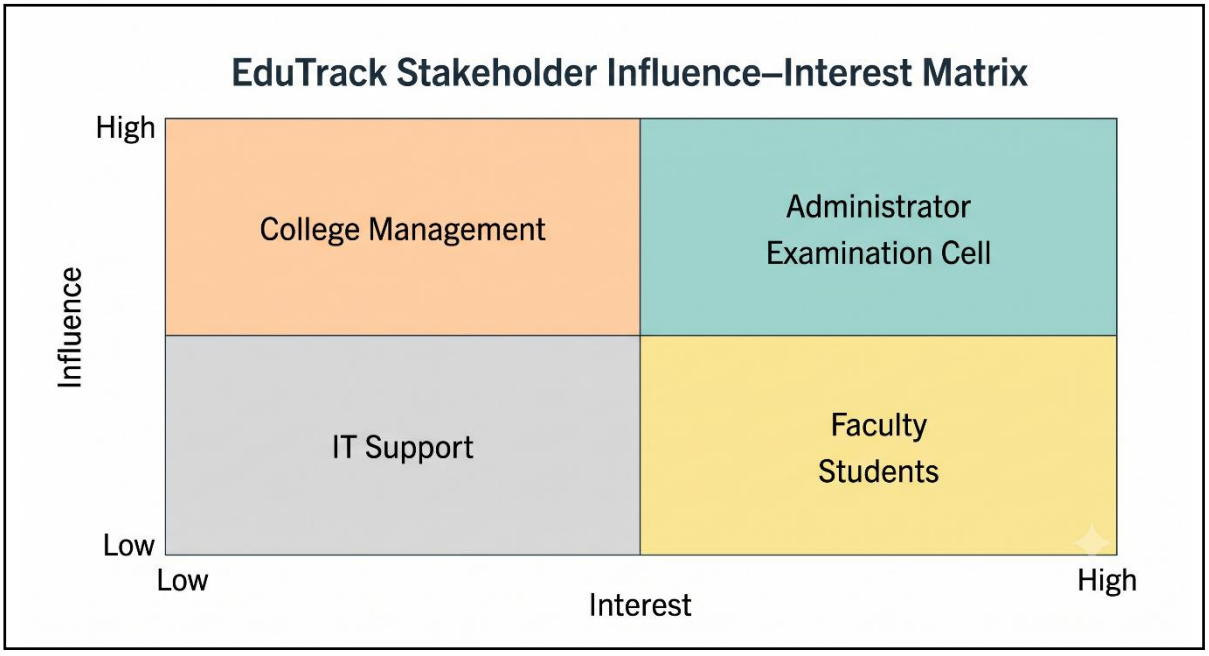

Persona	Main Goal	Main System Use
Student	Access personal academic information	Profile, courses, attendance, marks, results
Faculty	Manage student academic activities	Attendance, marks, course records
Administrator	Maintain academic information	Student records, courses, reports

8. Stakeholder Matrix

A stakeholder matrix helps organize stakeholders according to their level of interest in the EduTrack platform and their influence over the project.

8.1 Stakeholder Analysis Matrix

Stakeholder	Interest	Influence	Engagement Approach
Student	High	Medium	Collect feedback and test usability
Faculty	High	High	Involve in requirements and prototype review
Administrator	High	High	Regular consultation and requirement validation
Examination Cell	Medium	High	Consult for examination and result requirements
IT Support	Medium	High	Involve in technical and system requirements
College Management	Medium	High	Provide project progress and reports

8.2 Stakeholder Prioritization

Stakeholders with high interest and high influence require closer involvement during product planning. For EduTrack, faculty members and administrators are important because they manage major academic activities and records.

Students have high interest because they directly use the platform, particularly for accessing their academic information. Their feedback is important for improving usability.

The Examination Cell and IT Support should be consulted for examination-related and technical requirements. College management can be kept informed through project progress and important academic reports.

This matrix helps the EduTrack team decide who should be involved, consulted, or informed during different stages of product development.

9. Requirements Engineering Specification

Requirements Engineering is the process of identifying and documenting what a software system should do and the conditions under which it should operate.

For EduTrack, requirements are divided into two main categories:

- **Functional Requirements (FRS):** Describe the functions and services the system should provide.
- **Non-Functional Requirements (NFRS):** Describe the quality, performance, security, and usability expectations of the system.

9.1 Functional Requirements Specification (FRS)

The functional requirements define the major operations that EduTrack should support.

ID	Functional Requirement
FR-01	The system shall allow authorized users to log in according to their role.
FR-02	The system shall maintain student profile and academic information.
FR-03	The system shall allow students to register for available courses.
FR-04	The system shall allow faculty to record and update student attendance.
FR-05	The system shall allow faculty to enter and update internal assessment marks.
FR-06	The system shall maintain examination-related information.
FR-07	The system shall store and display student results.
FR-08	The system shall allow authorized users to search student academic records.
FR-09	The system shall generate academic reports.
FR-10	The system shall provide role-based access to student, faculty, and administrator functions.

9.2 Non-Functional Requirements Specification (NFRS)

Non-functional requirements define the quality characteristics that the platform should maintain.

ID	Category	Requirement
NFR-01	Security	Student and academic information shall be protected from unauthorized access.
NFR-02	Performance	Common operations such as searching and viewing records should respond within a reasonable time.
NFR-03	Usability	The interface should be simple and easy for students, faculty, and administrators to understand.
NFR-04	Reliability	The system should maintain accurate academic information and minimize data loss.
NFR-05	Availability	Authorized users should be able to access the platform when academic services are required.
NFR-06	Maintainability	The system should be structured so that future changes and improvements can be implemented easily.
NFR-07	Scalability	The platform should support an increasing number of students, courses, and academic records.
NFR-08	Data Integrity	Academic records should remain consistent and accurate during creation and updates.

9.3 Requirement Priorities

The requirements can be prioritized according to their importance for the initial product.

Priority	Important Requirements
High	Student records, course registration, attendance, marks, results, role-based access
Medium	Academic reports, search, examination information
Future	Additional analytics and advanced academic services

10. Product Vision & MVP

10.1 Product Vision

The vision of **EduTrack** is to provide a centralized academic management platform that makes student academic information easier to manage, access, and maintain throughout the academic journey.

The platform is designed to connect important academic activities such as student records, course registration, attendance, internal assessment, examinations, results, and academic reports within one organized system.

Product Vision Statement

“To provide a centralized and user-friendly platform that simplifies the management and access of student academic information for students, faculty, and administrators.”

10.2 Product Mission

The mission of EduTrack is to reduce dependency on scattered academic records and provide a structured system for managing academic information.

The platform aims to:

- Centralize important student academic records.
- Make academic information easier to access.
- Reduce repetitive manual record management.
- Support faculty in managing attendance and marks.

10.3 Product Objectives

Objective	Description
Centralized Records	Maintain student academic information in one platform
Easy Access	Allow authorized users to quickly access required information
Better Management	Simplify attendance, marks, courses, examinations, and results
Accuracy	Reduce errors caused by repeated manual record handling
Role-Based Access	Provide appropriate functions to different users

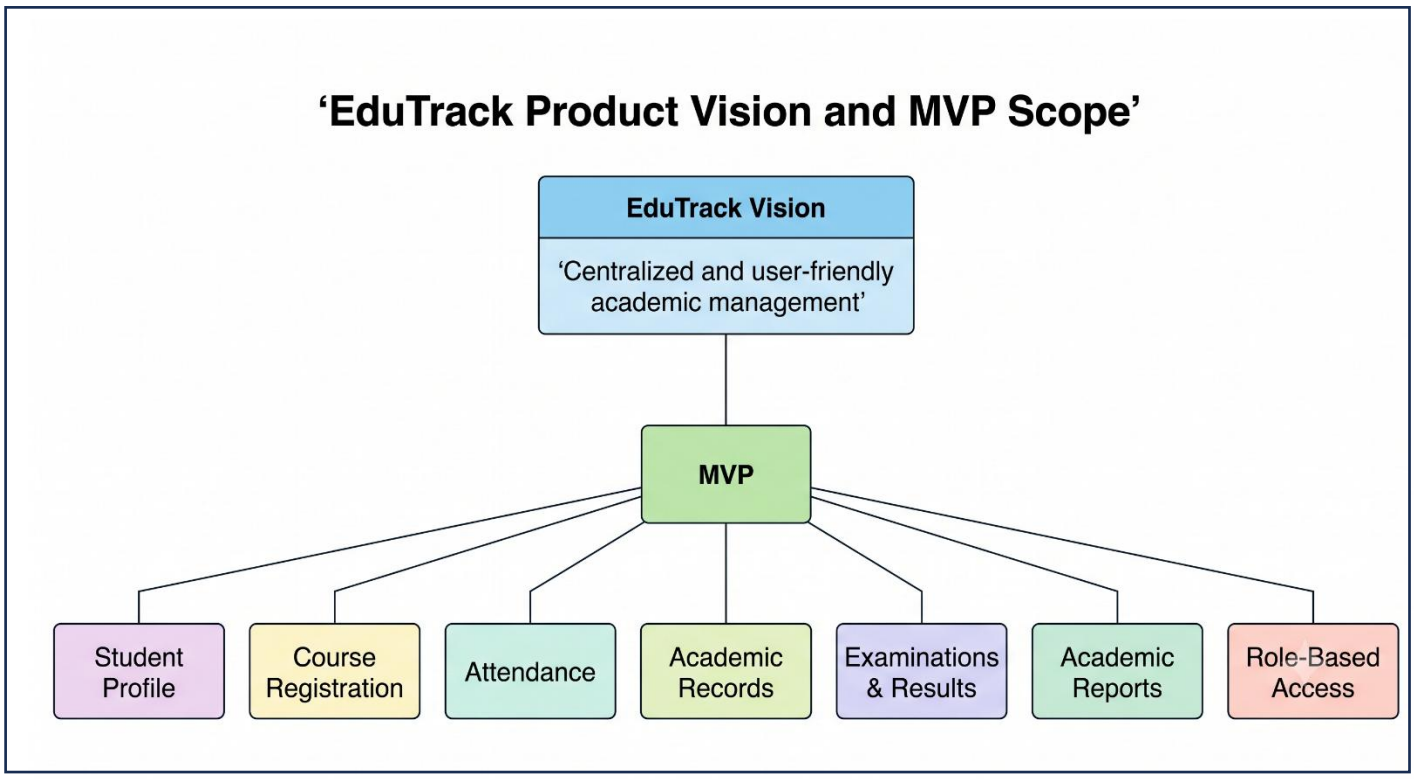

10.4 Minimum Viable Product (MVP)

The **Minimum Viable Product (MVP)** is the first version of a product that contains the essential features required to solve the main user problem.

For EduTrack, the MVP focuses on the core academic management activities rather than advanced features.

MVP Features

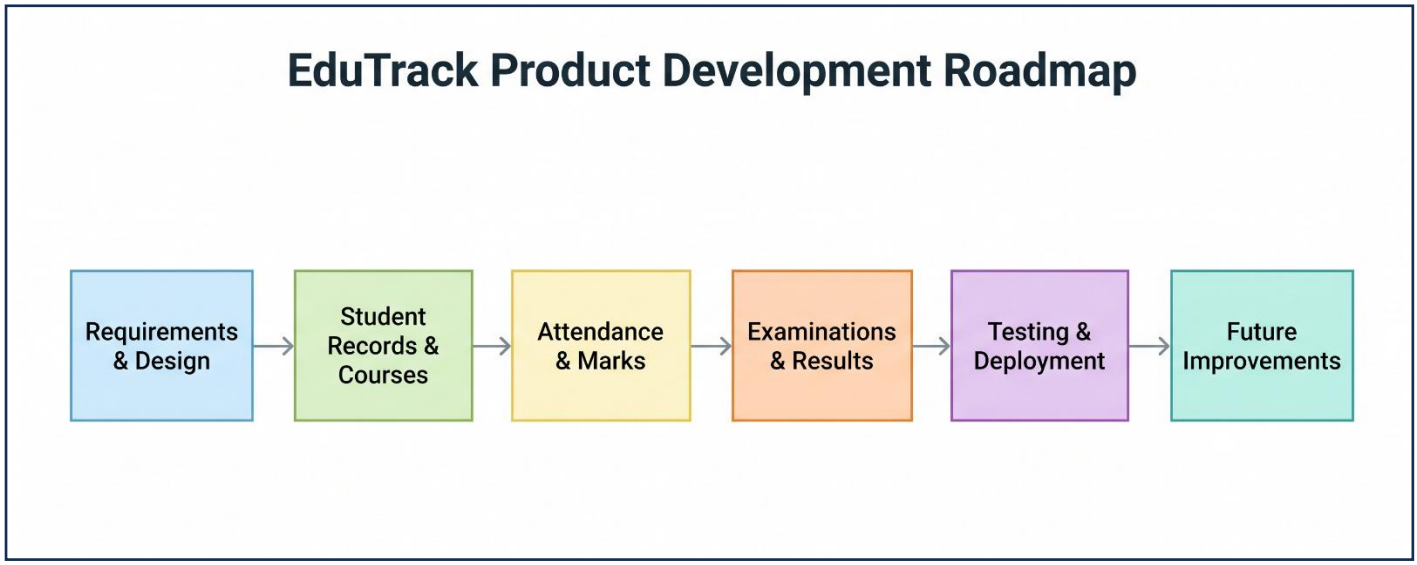

MVP Feature	Purpose
Student Registration & Profile	Maintain basic student information
Course Registration	Record student course selections
Attendance Management	Record and view attendance
Academic Record Management	Maintain internal marks and academic information
Examination & Results	Manage examination details and results
Academic Reports	Generate basic student academic reports
Role-Based Access	Separate student, faculty, and administrator functions

11. Enterprise Engineering Roadmap

The EduTrack roadmap defines the planned development of the platform from initial product planning to future improvements. It helps organize development activities in a structured order.

Phase	Planned Work
Phase 1	Requirement analysis and product design
Phase 2	Student records and course registration
Phase 3	Attendance and academic marks
Phase 4	Examination, results, and reports
Phase 5	Testing, deployment, and user feedback
Phase 6	Future improvements and advanced features

12. System Architecture & Repository Structure

The initial architecture of EduTrack defines how users, application services, and academic data will interact. It provides a basic technical structure for future development.

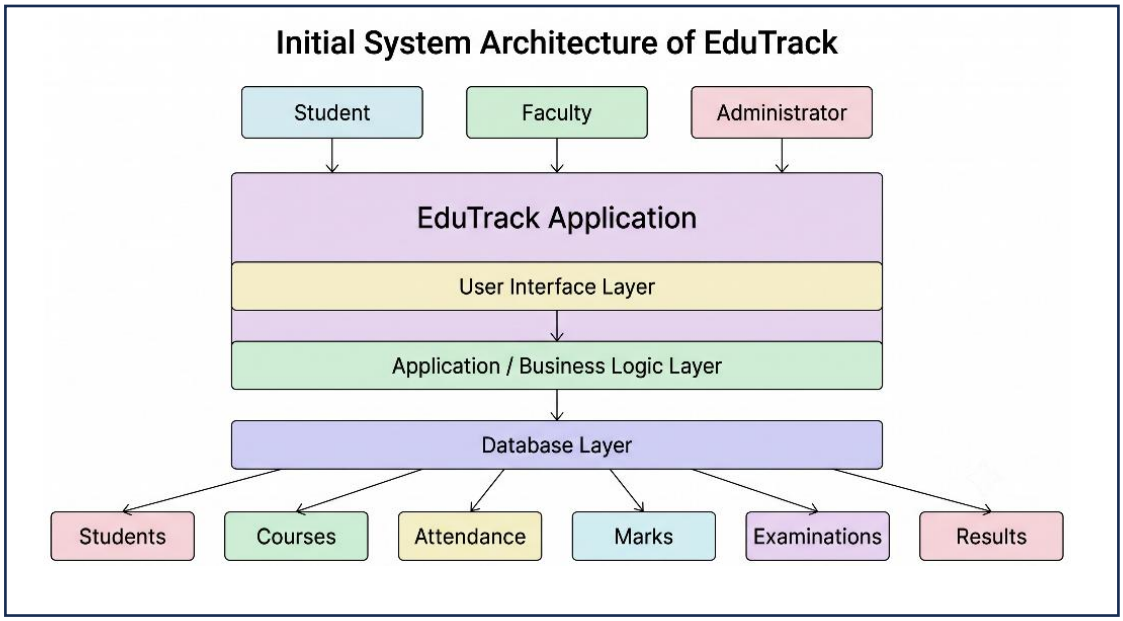

12.1 Initial System Architecture

EduTrack will follow a layered architecture:

Layer	Responsibility
User Interface	Provides interfaces for students, faculty, and administrators
Application Layer	Handles business logic and user requests
Database Layer	Stores student, course, attendance, marks, examination, and result data

12.2 Project Repository Structure

13. Project Charter & Planning

The project charter provides a basic plan for developing the proposed EduTrack platform. It defines the project purpose, scope, stakeholders, and major activities.

13.1 Project Charter

Item	Details
Project Name	EduTrack
Project Type	Student Academic Management Platform
Objective	Centralize and simplify academic record management
Primary Users	Students, Faculty, Administrators
Major Modules	Students, Courses, Attendance, Marks, Examinations, Results, Reports
Initial Deliverable	Product blueprint and MVP definition
Future Goal	Develop, test, deploy, and continuously improve the platform

13.2 Major Project Activities

The project will be planned through the following activities:

1. Understand the academic management problem.
2. Identify stakeholders and user requirements.
3. Define product requirements and MVP.
4. Design the system architecture.
5. Develop and test the platform in future phases.
6. Collect feedback and improve the product.

The project charter provides a common direction for the team and helps maintain focus throughout development.

14. Product Discovery Summary & Conclusion

14.1 Product Discovery Summary

The EduTrack project focused on understanding the academic management problem before starting actual software development. The project identified the main stakeholders, studied their needs, defined requirements, and planned the proposed product.

Design Thinking was used to understand user problems and develop a solution based on those needs. IBM Design Thinking and the Observe–Reflect–Make loop were also applied to support continuous improvement.

The project further defined the functional and non-functional requirements, product vision, MVP, roadmap, system architecture, repository structure, and project plan.

14.2 Conclusion

EduTrack provides a planned foundation for an enterprise-oriented student academic management platform. The proposed system brings important academic activities such as student records, course registration, attendance, marks, examinations, results, and reports into one structured platform.

This project demonstrates that successful software development begins with understanding the problem and users before writing code. The documentation prepared in Unit 1 can be used as a foundation for the future development, testing, deployment, and improvement of the EduTrack platform.

14.3 Future Scope

Future versions of EduTrack can include:

- Mobile application support.
- Notifications and reminders.
- Academic performance analytics.
- Integration with existing college systems.
- Automated report generation.
- Cloud deployment and monitoring.

These features can be considered after evaluating the MVP and collecting feedback from actual users.
